ABSTRACT

An antifungal composition suitable for parenteral administration to a mammal
includes an amount of pimaricin or an antifungal derivative thereof that is effective to
inhibit the growth of a fungal infection in a mammal; a pharmaceutically acceptable
dipolar aprotic solvent; and a pharmaceutically acceptable aqueous secondary solvent.
The composition can be used in methods of preventing or treating a systemic fungal
infection in a mammal. The composition can be prepared by dissolving pimaricin or an
antifungal derivative thereof in the pharmaceutically acceptable dipolar aprotic solvent;
adding to the solution a pharmaceutically acceptable aqueous secondary solvent; and in a
preferred method, by subsequently lypohilizing the composition, whereby a dry, shelf-
stable composition is produced. This dry composition can be reconstituted into an
aqueous solution suitable for parenteral administration.
